

2. Simulation Data - Scenario 1

Scenario title: The Room Is Fine

Context	Business traveler, second night of a three-night stay.
Visible service failure	The room was not serviced properly; the guest comes to the desk asking only for fresh towels.
Guest presentation	Calm, polite, restrained, and minimizing the problem.
Underlying concern	The guest has returned from a difficult family/medical situation and had expected the room to feel orderly and cared for. The guest is emotionally depleted and does not want another problem to manage.
What the guest actually needs	Fast operational recovery plus evidence that the hotel recognizes the burden the failure created. The guest needs restored control and care, not simply compensation.
Initial AI recommendation	Apologize, send fresh towels immediately, add a small loyalty-point/service-recovery credit, and close the case.
Why the AI recommendation is plausible	It is operationally efficient, solves the stated request, follows a common service-recovery pattern, and is not obviously unreasonable.
Why the AI recommendation is incomplete	It treats the stated request as the entire problem and does not test whether the guest's minimizing language is masking a deeper concern.

3. Guest Dialogue / Progressive Disclosure

The guest should not reveal the full problem immediately. The following lines are examples for building and testing. The implementation does not have to reproduce them word-for-word, but the emotional logic should remain consistent.

Trigger / Stage	Speaker	Example Line
Opening	Guest	Hi. It's really not a big deal, but my room wasn't serviced today. I just need a couple of fresh towels.
If student gives only the standard apology	Guest	That's fine. Thank you. It's just been a long day.
If student asks 'Is there anything else I can help with?'	Guest	No, no. The towels are enough. I don't want to make a big thing out of it.
If student asks a thoughtful, non-intrusive follow-up	Guest	Honestly, I was just hoping to come back tonight and not have to think about anything else.
If student appropriately acknowledges the burden	Guest	Yes... that's really it. I know it's a small thing. Today it just felt like one more thing.
If student immediately offers points/compensation	Guest	Sure, that's fine. Thank you.
If student asks intrusive questions about the family/medical issue	Guest	I'd rather not get into that. I just need the room taken care of.
If student offers a proportionate recovery and confirms preference	Guest	That would help. Thank you for taking care of it.
Strong closing state	Guest	I appreciate you checking. I feel much better knowing it's handled.
Weak closing state	Guest	Okay. Thanks.

4. Text-Based Emotional / 'Nonverbal' Proxies

Because Sprint 1 is text-based, do not depend on facial expression or tone of voice. Represent subtle human signals through language and lightweight textual behavior markers.

- Minimizing language: 'It's really not a big deal.'
- Contradiction: the guest says 'fine' while also saying it has been a very long day.
- Hesitation or pause: e.g., '[brief pause]' or a delayed/shortened response, if the interface supports it.
- Repeated refusal to impose: 'I don't want to make a big thing out of it.'
- Change in disclosure after a thoughtful question: more context appears only when the student demonstrates appropriate curiosity.
- Boundary signal: the guest should push back if the student becomes too intrusive.

5. Example Responses for Testing

A. Plausible but weak response

I'm very sorry your room wasn't serviced. I'll have fresh towels sent up right away and add 1,000 points to your account for the inconvenience. Is there anything else I can do?

Why it is weak: it is polite and operationally competent, but it treats the guest's stated request as the entire problem. It offers compensation before understanding whether compensation is what the guest values and creates an easy path to close the interaction.

B. Strong response

I'm sorry. After a long day, coming back to a room that wasn't taken care of is one more thing you shouldn't have had to manage. I'll get the towels to you immediately. Before I close this out, is there anything about the room or tonight that would make the rest of your stay easier?

Why it is strong: it acknowledges the burden without assuming private details, fixes the operational issue immediately, and invites additional information in a non-intrusive way.

C. Poor/inappropriate response

I understand. Can you tell me exactly what happened with your family today? If I know the details, I can decide what compensation you deserve.

Why it is poor: it crosses a privacy boundary, makes the guest justify emotional distress, and frames the interaction around compensation rather than care.

6. AI Recommendation Behaviors to Test

The AI should sometimes make subtle mistakes. These should be realistic enough that a student could reasonably follow them without careful judgment.

AI Behavior	Example	What Student Judgment Should Do
Over-indexes on compensation	Recommend points/credit immediately even when the guest has not indicated that compensation is important.	Student should recognize that compensation may not address the underlying need.
Closes too early	After towels are arranged, recommend closing the case.	Student should notice unresolved cues and consider one more question.

Treats stated request as complete truth	Assume 'I just need towels' means no other recovery is needed.	Student should evaluate the mismatch between minimizing language and contextual signals.
Overreacts	Recommend a large upgrade or excessive compensation.	Student should calibrate the response and avoid overcompensation.
Becomes intrusive	Recommend asking for personal details to understand the guest's difficult day.	Student should protect guest boundaries.
Good recommendation	Recommend immediate towels plus a brief empathetic follow-up before deciding whether anything more is needed.	Student should be able to ACCEPT when AI judgment is appropriate.
